

Unit 1

Lesson 4

Rotations with Polygons

Created with Doceri

Unit 1 – Geometric Transformations
Lesson 4 – Rotations with Polygons

Date _____ Pd _____

Part 1 – Regular Polygons and Rotational Symmetry

A **regular polygon** is a **polygon** that is **equiangular** (all angles are equal in measure) and **equilateral** (all sides have the same length). In the case of **regular polygons** the **center** is the point that is equidistant from each vertex.

1. Given *Regular Triangle EFG* with center O .
 - a. F is rotated about O . If the image of F is G , what is the angle of rotation?
 - b. \overline{FG} is rotated 120° about O . What is the image of \overline{FG} ? \overline{GE}

General Rule: The regular triangle has rotation symmetry with respect to the center of the polygon

and angles of rotation that measure 120° , 240° and 360° .

Side note: A regular triangle is also called an equilateral triangle or an equiangular triangle.

2. Given *Regular Quadrilateral EFGH* with center O .
- a. F is rotated about O . If the image of F is G , what is the angle of rotation?
 - b. F is rotated about O . If the image of F is H , what is the angle of rotation?
 - c. \overline{FG} is rotated 270° about O . What is the image of \overline{FG} ?

90°
 180°

\overline{EH}

General Rule: The regular quadrilateral has rotation symmetry with respect to the center of the polygon and angles of rotation that measure 90° , 180° , 270° and 360° .

Side note: A regular quadrilateral is often called a square.

3. Given *Regular Pentagon ABCDE* with center O .

a. C is rotated about O . If the image of C is D , what is the angle of rotation?

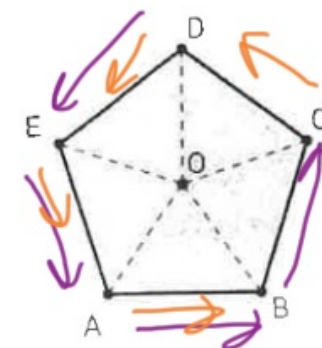

b. C is rotated about O . If the image of C is E , what is the angle of rotation?

c. C is rotated about O . If the image of C is A , what is the angle of rotation?

d. \overline{DC} is rotated 288° about O , what is the image of \overline{DC} ?

e. *Pentagon ABCDE* is rotated 72° about O , what is the image of *pentagon ABCDE* (in terms of the original points' labels – do not use $A'B'C'D'E'$)?

f. Explain the significance of the multiples of 72° .

72°

144°

216°

4

\overline{CB}

BCDEA

"Central Angle"

General Rule: The regular pentagon has rotation symmetry with respect to the center of the polygon and angles of rotation that measure 72°, 144°, 216°, 288° and 360°.

4. Given *Regular Hexagon ABCDEF* with center O .

- a. C is rotated 60° about O , what is the image of C ? D
- b. C is rotated 120° about O , what is the image of C ? E
- c. C is rotated 180° about O , what is the image of C ? F
- d. \overline{DC} is rotated 240° about O , what is the image of \overline{DC} ? BA
- e. Explain the significance of the multiples of 60° . 4 "central angle"

General Rule: The regular hexagon has rotation symmetry with respect to the center of the polygon and angles of rotation that measure 60° , 120° , 180° , 240° , 300° and 360° .

5. Given *Regular Octagon ABCDEFGH* with center *O*.

- a. When point *C* is rotated about *O*, the image of point *C* is point *D*. Describe the rotation (be sure to include degree).

R_{45° about Point *O*

- b. When point *C* is rotated about *O*, the image of point *C* is point *F*. Describe the rotation (be sure to include degree).

R_{135° about Point *O* / R_{225° CW About Point *O*

A regular polygon can be mapped onto itself if we rotate in multiples of the central angle measure.

The central angle of a regular polygon is found by _____

$$\frac{360^\circ}{n \text{ of sides}} = \text{Central Angle}$$

Part 2 – Parallelograms and Rotational Symmetry

6. Given *Parallelogram ABCD*, there is a center of rotation, O , that will map point A onto point C .

a. What are the coordinates of O ?

$(4, 1)$

b. What degree of rotation mapped C onto A using the center O ?

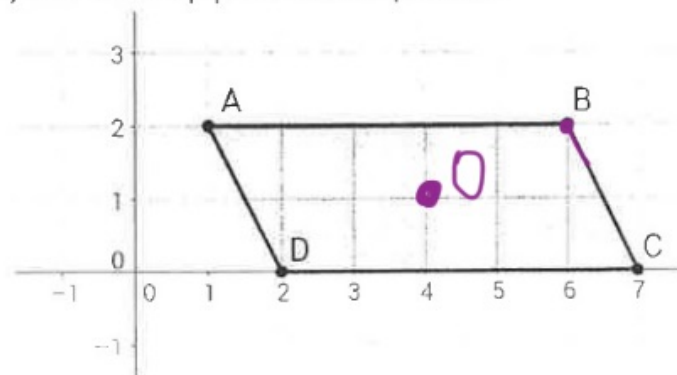

R_{180° about O

R_{180° CW about O

c. If we rotate the parallelogram around center O using the degree measure found in part b, $\angle D$ maps to $\angle B$.

d. If $\angle A$ maps to $\angle C$, then $\angle A$ and $\angle C$ are \cong , congruent.

e. If $\angle D$ maps to $\angle B$, then $\angle D$ and $\angle B$ are \cong .

4.

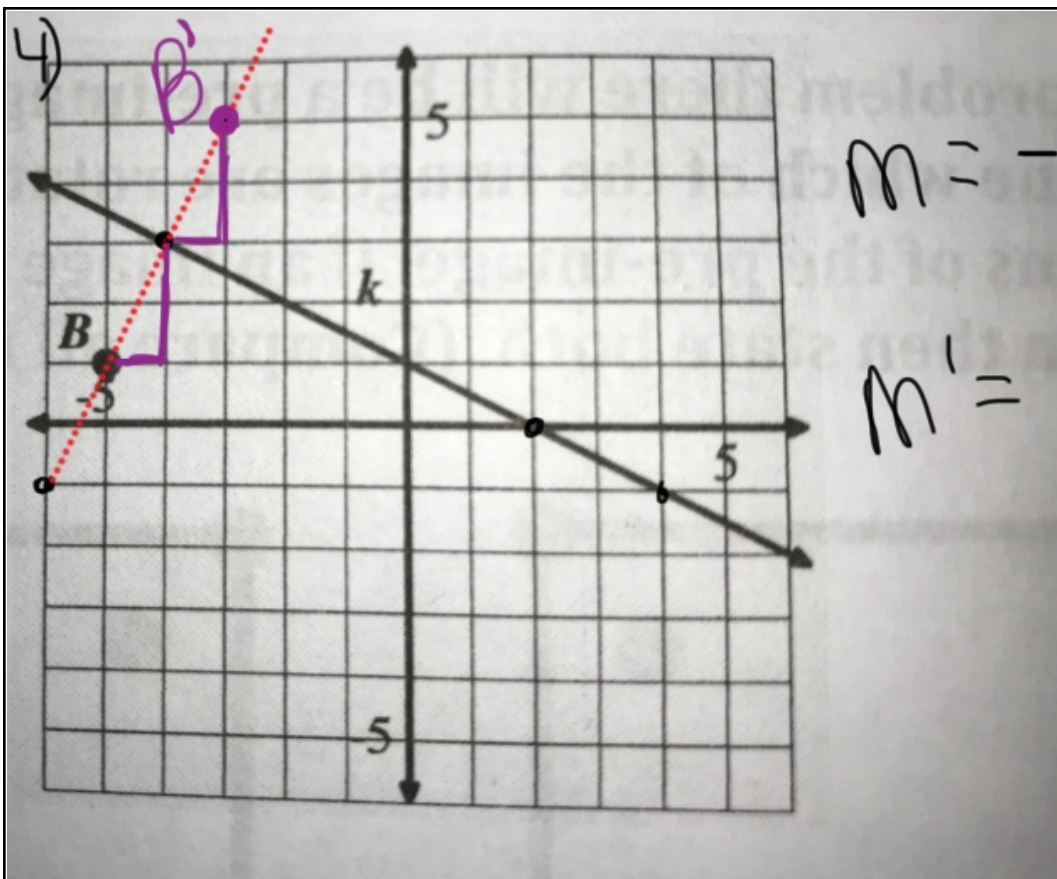

Slope of reflection
 $M = \frac{\text{rise}}{\text{run}} = \frac{3}{1} = 3$

⊥ opp. rec slope $-\frac{1}{3}$

Start at given point and use opp. reciprocal slope to get line where reflected point lies.

Draw right Δ 's to be equidistant
